

There are three branches:

RestAPI

- Once the changes are done, view git changes and make the commits.
- When you sync the changes there can be merge conflicts, for system based conflicts, go for local changes or current changes.
- In case of other conflicts, compare the local and incoming changes and do as your application demands.

Angular

- In case of angular, the node modules will not be pushed into the git branch so once you clone make sure you run npm init, so the node_modules are initialized.
- For merge conflicts, compare the incoming and local changes and do as your demands.
